

# Investigation of an Electromagnet

Landon Rogers/ School of Science and Technology, Georgia Gwinnett College

## Introduction

The main point of this experiment is to investigate an electromagnet and determine what exactly affects its magnetic field. So a master equation can be formulated. The parts that will be studied are number of nails, length of solenoid, number of turns, and number of batteries.

## Materials

- 28 AWG magnet wire
  - D or C batteries
  - 3 inch fluted nails
  - Paper clips
  - Food scale
  - Wire cutters
  - Sand paper
  - Electrical tape

## Procedure

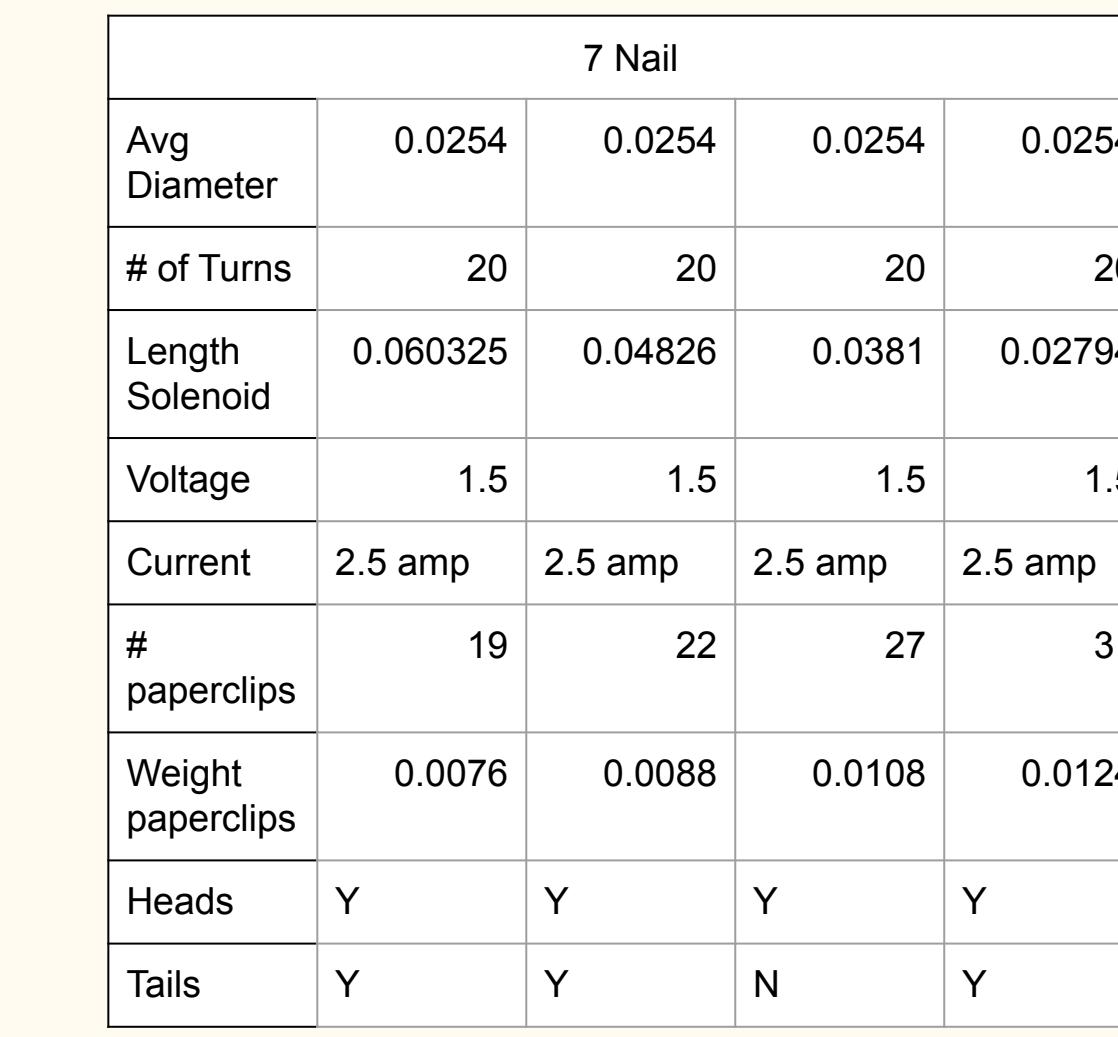

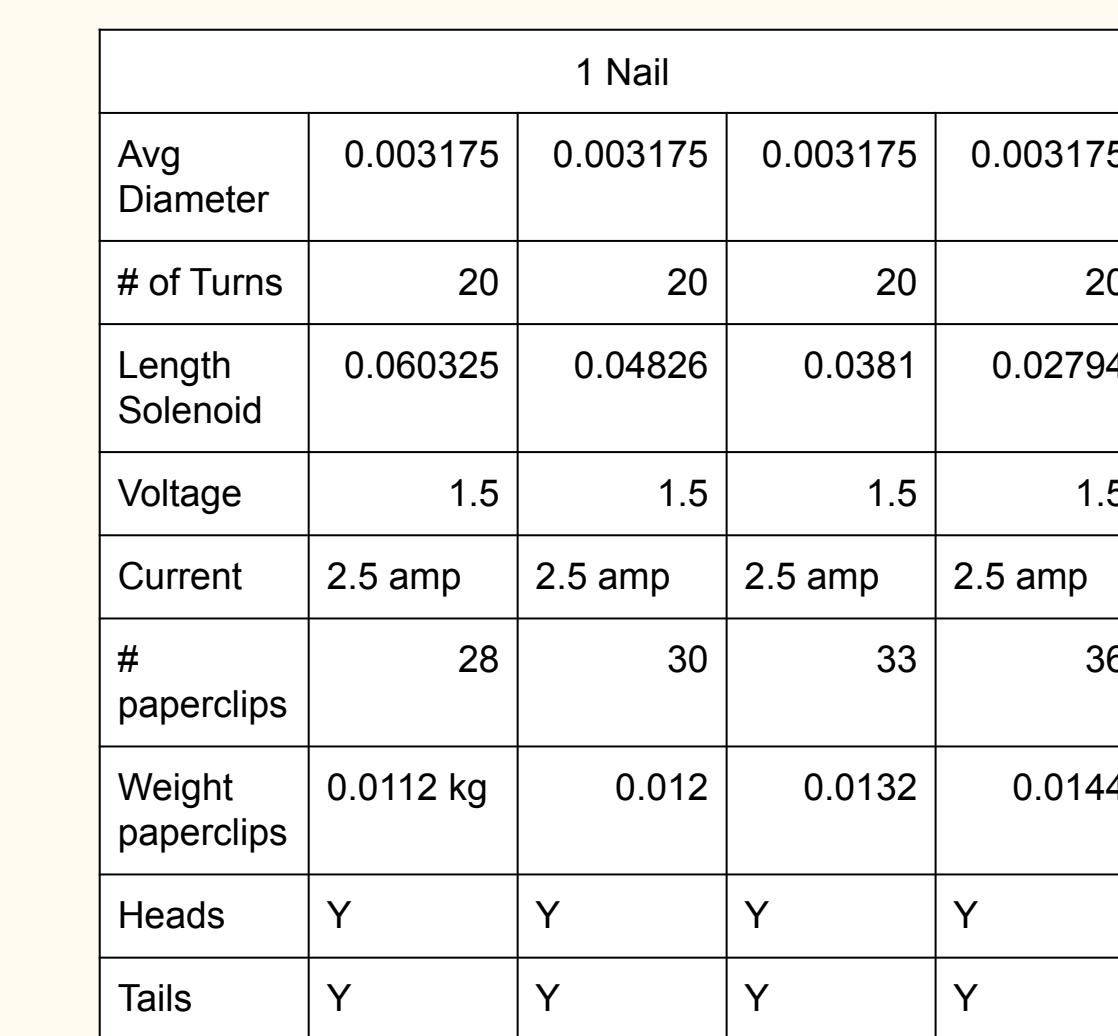

### Step 1: number of nails

- Wrap 1 nail with 20 turns of the wire
- Measure Length and Diameter od the coil
- Connect battery and pick up paperclips
- Repeat above for 3, 5, 7, and 9 nails

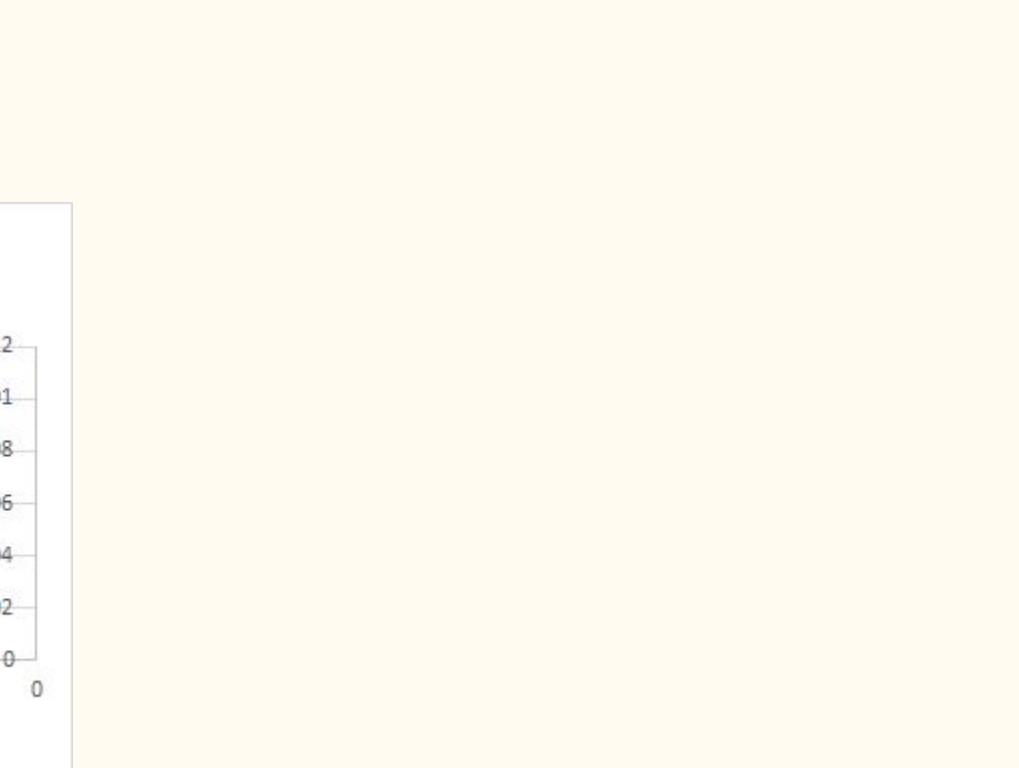

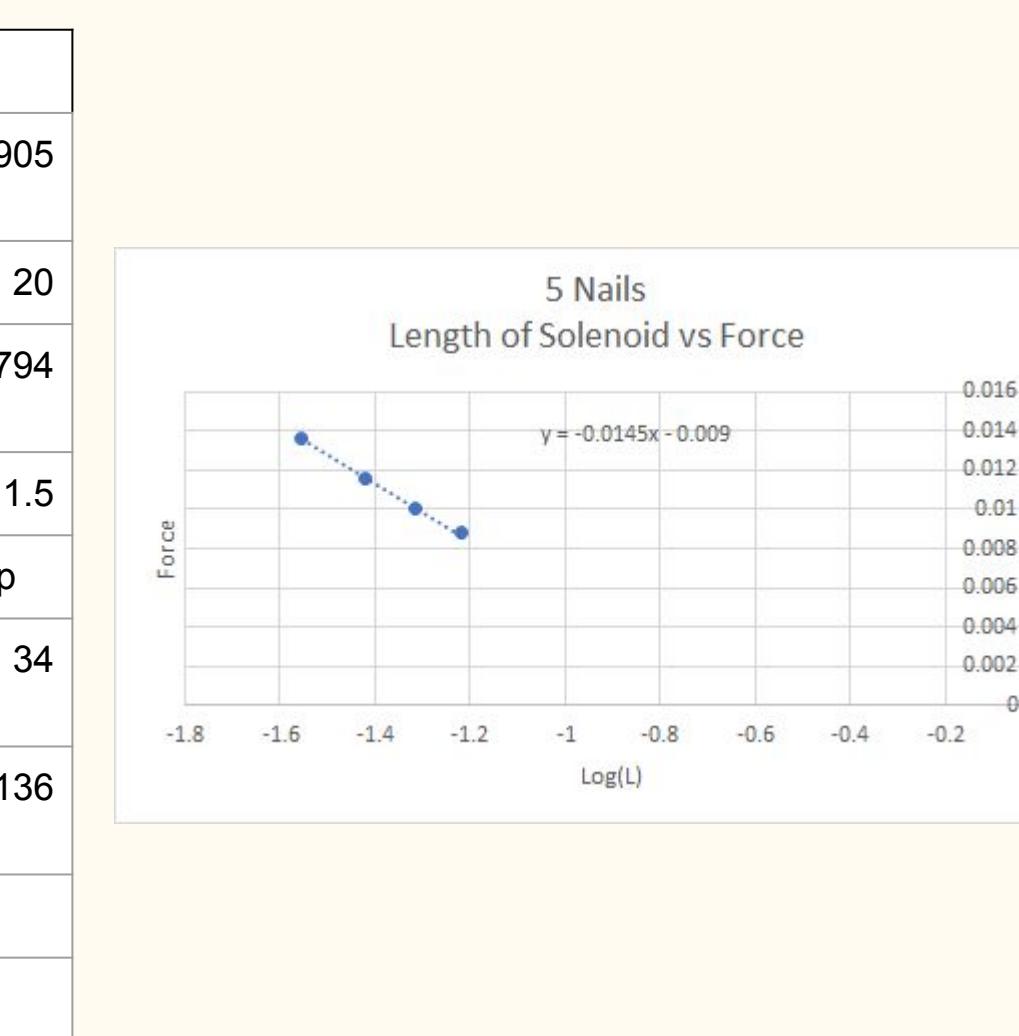

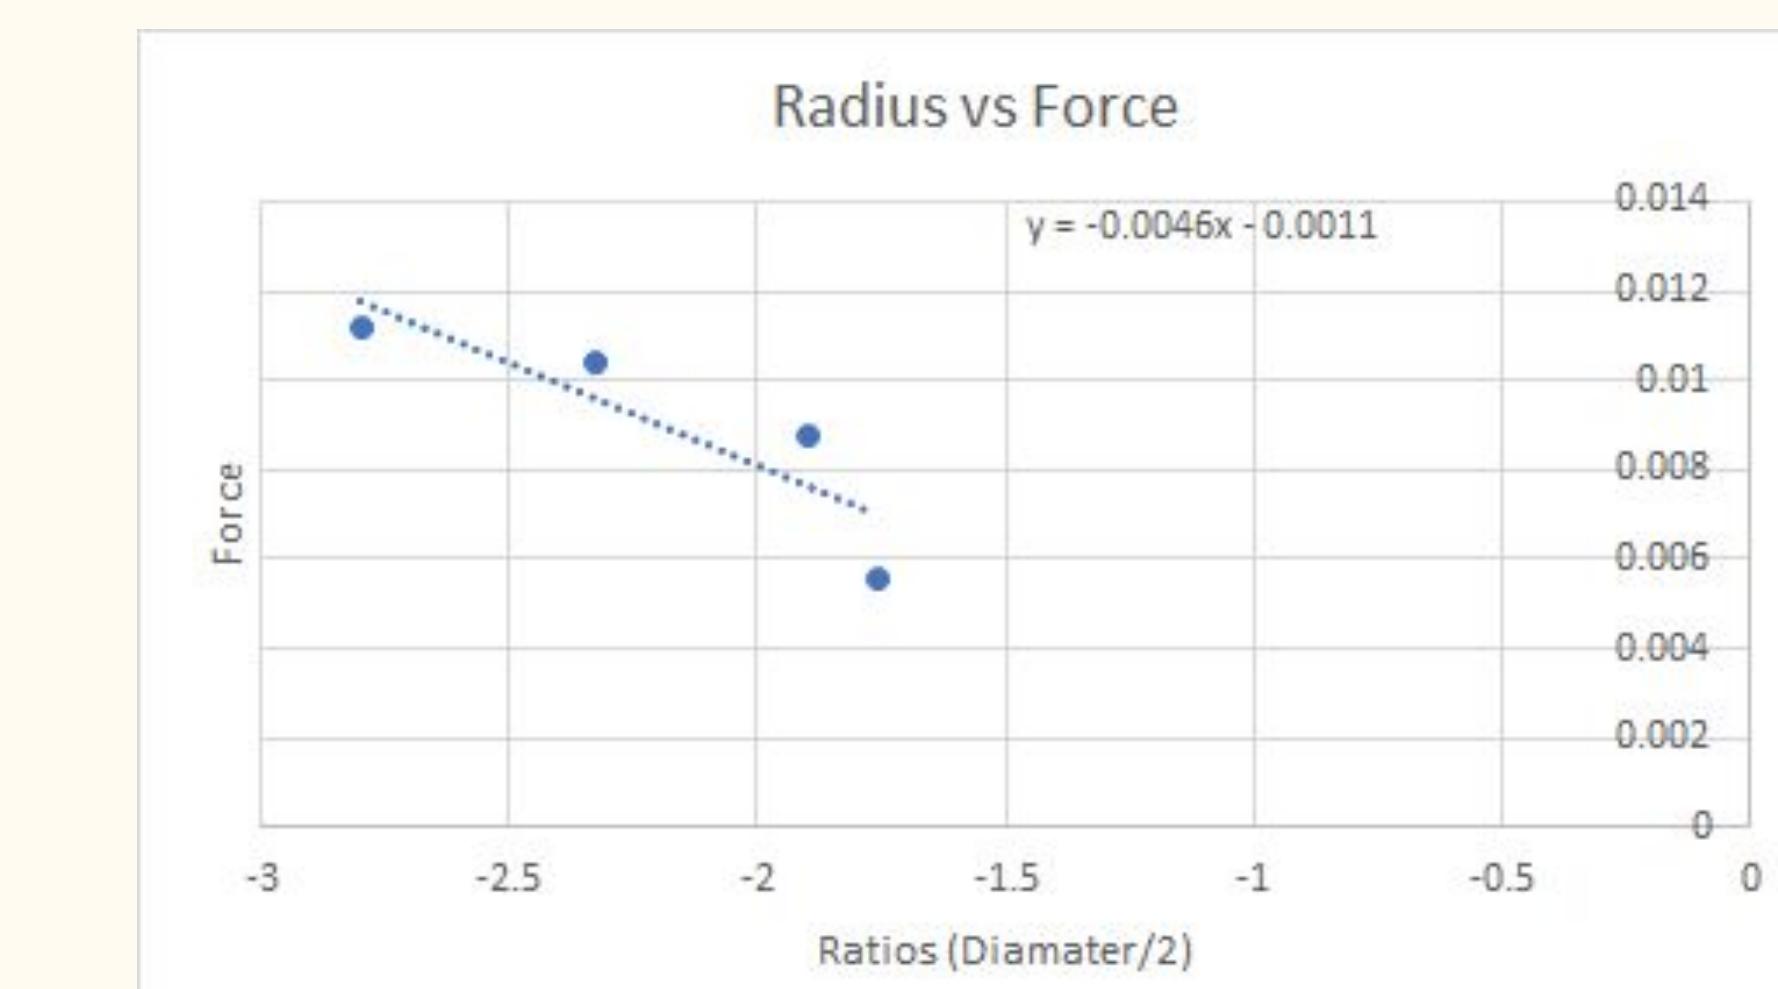

### Step 2: length of solenoid

- Using the models from part one decrease the length of the coil by 80%
- Run the experiment
- Decrease the coil at least 2 more times and run the experiment
- Repeat for 3, 5, 7, and 9 nail bundles.

Part 1					
Number of Nails	1	3	5	7	9
Avg Diameter (m)	0.003175 m	0.009525 m	0.01905 m	0.0254 m	0.034925 m
Number of Turns	20	20	20	20	20
Length of Solenoid (m)	0.060325 m	0.060325 m	0.060325	0.060325 m	0.060325 m
Voltage	1.5	1.5	1.5	1.5	1.5
Current	2.5 amp	2.5 amp	2.5 amp	2.5 amp	2.5 amp
Number paperclips	28	26	22	19	14
Weight paperclips (kg)	0.0112 kg	0.0104 kg	0.0088 kg	0.0076 kg	0.0056 kg
Heads	Y	Y	Y	Y	Y
Tails	Y	Y	Y	Y	Y

## Tables & Graphs

## Analysis

The entire experiment could not be completed but for the parts that could be found are R and L. R is  $1/R^{0.0046}$  and L was averaged from the multiple nail bundles to be  $1/L^{0.0155}$ .
